

Perspectives for Alternative Energy Sources

Electricity consumption in our country is increasing every year. If in 2000 the monthly consumption of one family was 114 kWh, now it has increased to 175 kWh. Currently, the accelerated introduction of alternative sources of electricity is one of the priorities of our country. That is why research centers have been studying the country's energy sector for several years in order to introduce modern technologies for the use of alternative energy. The use of renewable energy sources in the future is necessary to ensure energy, environmental and economic security in the country and for the sustainable development of the energy sector. A necessary condition for the conservation of natural resources and environmental protection for future generations is the development of renewable and alternative energy sources.

Professors and teachers of the institute conduct research to provide students with new information on renewable energy and modern means. Among them: teachers of the department of energy supply and renewable energy sources A.I. Anarbaev, A.K. Davirov, under the leadership of the head of the department, D.B.Kodirov, collaborate with organizations producing equipment for renewable energy sources, and also share theoretical and practical knowledge. Partner organizations provided the department with energy equipment developed by their organization, wished the department further development and success in training advanced specialists in renewable energy sources.
