

Risk of coronavirus

February 6, in the Students' Dormitory Chief Medical Officer B.Eshniyozov, Nurse Kh.Khaitova gave a lecture on prevention of coronavirus. Coronavirus infection, which is now common in China, is a major concern for the world. What kind of disease is that? Coronavirus infection is a new type of acute respiratory viral infection, with symptoms starting as simple as colds. In other words, the virus, which starts with fever, cough, shortness of breath, and eventually dies, destroys the digestive and nervous systems, including the heart, liver, kidneys and eyes.

It has been reported that the disease is transmitted mainly from birds and animals to human beings. So far, it is the seventh type of coronavirus, which mankind is familiar with. The virus is believed to have spread from the Chinese seafood market. Scientists who have analyzed the genetic code of the new virus have predicted that the disease will be similar to the Sars virus that killed 900 people in dozens of countries, mostly in Asia, in the early 2000s. According to recent data, more than 80 people have died in China due to a recent coronavirus infection, and more than 2,400 are sick. Students of the faculty MHW, HC,ESAWR actively participated in the event.
