

The role of science in integrating the theory and practice

On July 9, 2021, Bukhara branch of Tashkent Institute of Irrigation and Agricultural Mechanization, specializing in land reclamation and cultivation, 1st year doctoral student Nurov Dilmurod Elmurodovich, Professor Matyakubov Bakhtiyar visited the Christian farm " Said Imam Tilav "in Vobkent region of Bukhara research on the topic of the dissertation. During the visit, he met with the chairman of the state farm Odil Imams.

This was followed by research work conducted by the researcher on a programmatic basis. The researcher was introduced to the placement of variants and iterations in an experimental system. Errors and shortcomings found during scientific research, suggestions and advice on problems are given. Opinions and conclusions were given on the causes of wilt disease, especially wilt disease and saline farm areas. At the time, one of the problems with drip irrigation of bedbugs was making clear recommendations to farmers and researchers on how to prevent weed growth.

Prof. B. Matyakubov thanked the farmer for supporting scientific research in this area. It was noted that there is a need for these recommendations on agronomic measures to be carried out in the field during the year, and such a message will inform the results of future studies of other farms. The visit of farmers and his workers and doctoral student D. Nurov to observe field research was eventful and interesting. It should be noted that from such a practical point of view, cooperation of farmer-doctor-scientific supervisor in the field of R&D is an excellent opportunity.
