

From the history of the irrigation system on television

It is important to suggest that professors and doctorate students of the department "Humanities" of TIAME participated in the program "The History of irrigation in Uzbekistan" on TV channel "The History of Uzbekistan". Chair of the department Sh.M. Uldjaeva, associate professor M. Khakimova, doctorate students of the basic course R. Zafarzhonova, M. Makhmudova informed about the results of their research in this program. From the history it is known that civilizations are formed in close connection with irrigation systems. We took part in the demonstration of this type of irrigation systems. Undeniably, water has become a life and death problem, particularly in Central Asia, where artificial irrigation is used. It is not a secret that there were no civilizations in water-problematic areas. Ancient Egypt, Mesopotamia, cities and states in Central Asia arose and developed in wetlands. Surprisingly, the exhibition uses different samples to reveal the historical processes in the field of irrigation in our country, the development of the government and society in the connection with water.

At the Department of Humanities, Tashkent Institute of Irrigation and Agricultural Mechanization Engineers, a scientific and innovative laboratory "The Research Center for the History of Irrigation in Uzbekistan" has been established. In this laboratory, the history of irrigation in Uzbekistan and around the world is constantly being studied, and the results of the research are regularly promoted in the media, in particular, on the "History of Uzbekistan" TV channel.
